Category:2011 film remakesCan software avoid AWS security restrictions for on-premises deployments? We're thinking of moving several large Drupal sites to AWS EC2 and Kubernetes. Some of them, however, will be deployed on EC2 in AWS availability zones in an attempt to avoid security restrictions associated with running in US East or in another EC2 Region. These sites will include a lot of traffic, so the minimal data transfer cost is an important factor. However, we don't want to use a fake region to avoid security restrictions - we need to run the sites in an EC2 Region approved for hosting US East sites. Is there any way to do this? The only thing I could think of was to create several Fargate services in US East and all of them point to the same EC2 instance in US West. But it looks like AWS Fargate doesn't support static IPs and from the "Fargate" sample YAML file it seems that you can't add AWS Security Groups to a Fargate service. Is there any way to do this otherwise? A: You can also do this using Cloud Front as the content delivery service and doing some data/logic splitting to make it work. You can set a 301 redirect from the EC2 instance to the Cloud Front instance in a US region and the incoming requests are then handled in the US region. You will need to set up some routes in your CloudFront distribution to make the redirect happen. This is not the exact same thing as using an EC2 instance in the US but it allows you to circumvent the security restrictions. Q: Disable "show this page as" in Windows 7 when moving to url in browser I'm using Windows 7 on a laptop with multi-monitor. If I am browsing the internet on Firefox 3, and my cursor is on a link on a webpage, the address bar gets copied as an X. So, I press Alt+Ctrl+Shift+N to open a new tab, but Firefox 3 opens in the URL that was already open, instead of in a new window. What's wrong? Is there any way to disable the "show this page as" option in the address bar? A: You don't need to edit the registry to disable the Address Bar. Right-click the address bar and then click Settings In the menu that appears, click Text Box Options f678ea9f9e
